1. Overview

This is the first release of the VerifyDoc backend. It delivers the complete set of services behind VerifyDoc's core flow: institutions issue credentials, citizens keep them in a private wallet and choose who can see them, and approved employers verify what is shared with them.

This release covers the backend only. Web and mobile integration, real-user acceptance testing, and production deployment checks follow in later releases, so this is not a customer-facing launch.

2. What's New

2.1 Accounts and Access

- Added registration and login for citizens, employer organizations, and institutions, using JWT authentication.
- Added email verification and password reset using one-time codes.
- Added profile updates for signed-in users.

2.2 Onboarding and Administration

- Added employer and institution registration with supporting documents.
- Added a Platform Admin approval queue. Employers and institutions can access protected features only after approval.
- Added an admin dashboard summary and a user list.

2.3 Credentials and Wallet

- Added credential issuance by approved institutions.
- Added citizen credential upload (PDF, up to 5 MB). The issuing institution reviews each upload and verifies or rejects it.
- Added credential revocation by the issuing institution. Credentials are corrected by revoking and reissuing.
- Added a private citizen wallet with filtering and pagination.

2.4 QR Verification

- Added QR code generation for each credential.
- Added public credential verification through a signed token, limited to 30 requests per minute per IP address.

2.5 Credential Sharing

- Added citizen-controlled sharing: a citizen shares one credential with one approved employer, sets a purpose and an expiry of up to 365 days, and can revoke the share at any time.
- Added employer access to shared credentials. Employers see only active, unexpired shares, and the private document link is never included.

2.6 Fresh Confirmation

- Added employer requests for fresh confirmation of a shared credential.
- Added institution responses of **Confirmed** or **Disputed**, with a note required for disputes.

2.7 Security and Quality

- Added password hashing, role-based access, approval status checks, ownership checks, and request validation.

- Added automated tests, including database-backed integration tests. The security workflow passed on the latest changes.

3. Breaking Changes

None. This is the first release.

4. Known Issues

- Institution registration currently fails with `400 Invalid role`. A related verification-email bug follows once that is fixed.
- Replacing a profile picture may not remove the old image.
- There is no refresh-token mechanism, so users sign in again after 1 day.
- Rate limiting applies only to the public verification endpoint.
- There is no endpoint to delete an account.
- The employer share list doesn't report a total page count.

5. Coming Next

- Real-user acceptance testing and deployment checks
- Production hardening, including backup and recovery and network-level protections
- Notifications and audit logs
